

ABSTRACT

A method of disassembling a washing machine is a disassembling method for a washing machine including a reduction-gear unit (66) secured on the outside of a water tub (65) and a dehydration tub (12) disposed in the water tub (65), and the method
5 includes a release step of applying force, along the axial direction of a rotary shaft (16), in the direction of separating the reduction-gear unit (66) and the dehydration tub (12) from each other to release connection between the reduction-gear unit (66) and the dehydration tub (12). This scheme can be employed to provide a method of
10 disassembling a washing machine that can recover resin included in the washing machine at a high recovery ratio.
